

Korespondensi / Proses Review

Figure 5. Information on name of the village.

There are a total of 888 villages in 80 sub-districts spread across the Greater Bandung area. Bandung Regency has 280 villages, Bandung City has 151 sub-districts, West Bandung Regency has 165 villages, Cimahi City has 15 villages, and Sumedang Regency has a total of 277 villages. The hardware and software specifications used to implement the mapping application for the Greater Bandung area can be seen in Table 1.

Hardware Type	Specification
Processor	Shared Hosting
Space Hardisk	1.5 GB
RAM	1 GB
Browser	Google Chrome
XAMPP	Version 3.2.4
Webserver	Apache
PHP Version	7.3
Apache version	2.4.46
Sever Name	Lato
PHP Version	7.2.33
MySQL Version	10.3.27-MariaDB
Operating System	Linux

The web server used in this application is Apache because the apache web server has superior performance in data transfer (Setiawan et al., 2019). Application testing is carried out by functional testing, which displays the five regions in the Greater Bandung area and testing to display 888 villages. Based on BlackBox functional testing, 100% of the area can display information as expected. The results obtained from the tests carried out show that each area can be displayed on the map well, including 888 villages. It can display area name information when the user selects a polygon area.

Applications in this research have been able to display spatial information from five regions in Greater Bandung. Further research is planned so that this application can display non-spatial data as needed. It

This log is because it takes time for the system to load all the information in GeoJSON. Besides, the information displayed does not take too long. It is hoped that the implementation of applications related to the spatial use of better server and network specifications. It is recommended to use a Virtual Private Server to get better performance (Balen et al., 2020), not using the concept of a shared hosting server.

CONCLUSION

Based on the results of the research that has been carried out, it is concluded that the mapping application can be useful for knowing the spatial data of each region which, if developed with non-spatial data, can be known the distribution of potentials contained in each region.

ACKNOWLEDGMENTS

Authors wishing to acknowledge UNIKOM and Ministry of Education, Culture, Research and Technology National Research and Innovation Agency (RISTEK) and support this research using grant Penelitian Riset Terapan (PRT) contract number. The Research Contract for Multiple Years Nusi Contract Number 110 / SP2H / LT / DRPM / 2019, number 008/SP/LP/UNIKOM/VII/2020 and 019/SP2H/LT-AMANDI.

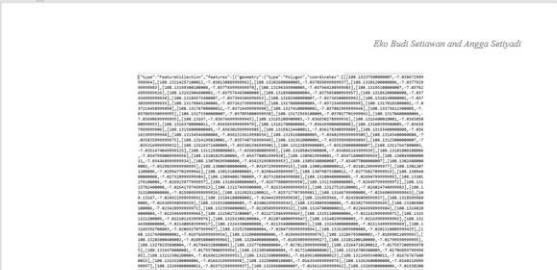

Figure 2. Stages of getting coordinates from shapefile.

So that the resulting coordinates can be used in the system, the next step is to convert them into GeoJSON format so that they can be used to display spatial data (Horbuzski & Lorek, 2020; Zhu & Tan, 2018). GeoJSON also has good encoding and decoding performance when used in geographic information (Tong, 2018). This conversion process uses the tools from geojson.io, as shown in Figure 3.

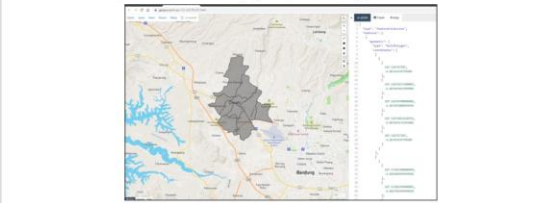

Figure 3. Stages of getting the Geojson format.

The next stage is system and software design. This stage is carried out the design from the procedure, functional, database, model to display design. After the design is complete, the next step is to implement it

Mapping application for greater bandung area using web technology

RESULTS AND DISCUSSION

Data Analysis for New Business Actors

The application in this research can be accessed via the internet at the address http://wirusaha.web.id/view.php?menu=gis&act=frm_gis as shown in Figure 4.

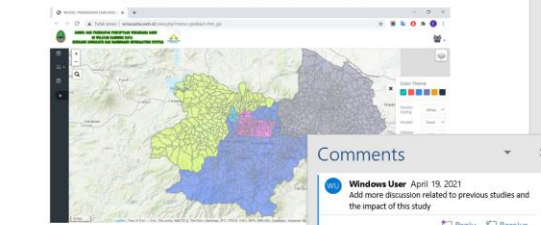

Figure 4. Map display results for the Great

There are five regions shown in the application. The five regions are Bandung City with a pink map, Bandung Regency with a blue map, Cimahi City with a cyan map, West Bandung Regency with a green map, and the Sumedang Regency area with a gray map. To display the map in Figure 5, use a script like the following.

```

var layer_ADMINISTRASI = new L.GeoJSON.AJAX({assets_gis:layerrequest_mapa_layer.php},{ //
sekarang perintangnya diawali dengan variabel
style: function(feature){
var fillColor; // ini style yang akan digunakan
kode = feature.properties.KOT_KAB; // perwarnaan objek polygon berdasarkan kode
kabupaten di dalam file geojson
if ( kode == "kota_cimahi" ) fillColor = "#00ccff";
else if ( kode == "kota_bandung" ) fillColor = "#ff4d4d";
else if ( kode == "KBB" ) fillColor = "#d21f4d";
else if ( kode == "kabupaten_bandung" ) fillColor = "#3366ff";
else if ( kode == "sumedang" ) fillColor = "#8585ad";
else if ( kode > 5104 ) fillColor = "#3ab7e9";
else if ( kode > 5103 ) fillColor = "#6c8b96";
}

```

Figure 1 Stages of the research carried out

Data Collection Stages

This stage was the initial stage when carrying out research. This initial stage consists of a literature study, observation, and interviews. Literature studies consist of collecting information from journals, proceedings, and reference books (Orlando et al., 2020). Another stage was observed. This research is intended for use by the general public and government agencies. Direct surveys and observations are carried out to ensure that other sources' spatial data is valid. This direct observation needs to be done to combine the available data sources with (Smith & Sparkes, 2016) the survey results. This research stage results from the latitude and longitude coordinates of 80 districts and 888 villages in the Greater Bandung area, which are implemented as regional boundary polygons.

Another stage in data collection was an interview. The interview stage was used to obtain data related to experience and knowledge (Smith & Sparkes, 2016). Interviews were carried out in the research, namely to the community directly, to get the desired feedback regarding the area

the Office of Cooperatives and Small Businesses of West Java Province. Interviews with government agencies were conducted to obtain primary data sources related to spatial areas in the Greater Bandung area.

Software Development Life Cycle Stages

The next stage was the stage when building the system. This stage used the concept of a Software Development Life Cycle with a waterfall model. This waterfall stage is widely used when building a system, including monitoring applications (Affi et al., 2020), reporting (Rahayu, 2020), calculating (Rakmat & Rizki, 2020), and geographic information systems (Amanillah, 2020), such as in this research. Several stages were carried out: requirement definition, system and software design, implementation and unit testing, integration, system testing, and the last step, namely operation, and maintenance.

The first stage in the software development life cycle waterfall model was the requirements definition. Data in research related to mapping applications is the need for spatial data in the form of polygons containing the boundaries of the area displayed in the application. These areas are Bandung City, Bandung Regency, West Bandung, Cimaahi City, and Sumedang Regency. The results of this stage obtained the latitude and longitude coordinates of the areas in Greater Bandung. The coordinates for each region are obtained from the government agency, in this case, the General Government and Public Housing. The coordinates obtained are of type Shapefile file with the format *.shp.

The second stage in the waterfall model was system and software design. Some of the development tools used in this research were ArcGIS, leaflets, MySQL database, SQL-Yog, and Visual Studio. The specific steps to get the coordinate format displayed in the application are shown in Figure 2.

Mrs. Pooja Vijayan via Open Journal Systems <jer@ku.edu.kw>
to ASSEEE, me, Angga

Mon, Dec 13, 3:01 PM (13 days ago)

Dear ASSEEE Conference, Eko Budi Setiawan, Angga Setiyadi,

I am pleased to inform you that your paper entitled "Mapping application for Greater Bandung Area using Web Technology" has been accepted for publication in the **Journal of Engineering Research (JER)**.

The DOI number for this paper will be : 10.36909/jer.ASSEEE.16093*

The editorial board would appreciate it if you cite some papers related to your field in previous issues of our journal (JER).

JER looks forward to more distinguished submissions from you and your colleagues.

Tentatively your paper will be published in the (March/June/September/December 2023) issue.

Please write back to JER to confirm and acknowledge receipt of this mail.

With best wishes,
Prof. Ameer Al Haddad
Editor-in-Chief

* DOI will be activated only after online publication.
