

Pemrograman Berorientasi Objek

Class 2

Object-Oriented
Programming:
The Basic Building Blocks

Adam Mukharil Bachtiar
Teknik Informatika UNIKOM

Class 2

1. Deklarasi Objek
2. Penggambaran Objek
3. Kata kunci this
4. Kata kunci statis
5. Overloading Method
6. Array of Object
7. Parameter

Deklarasi Objek C++

```
<nama_class> <nama_objek>;
```

MAHASISWA MHS1;

Deklarasi Objek Java

The 3 steps of object declaration, creation and assignment

The diagram illustrates the three steps of Java object declaration, creation, and assignment. It shows the code:

```
Dog myDog = new Dog();
```

Step 1: Declaration - The variable type 'Dog' and name 'myDog' are underlined by a bracket above the equals sign. The number '1' is placed above the bracket.

Step 2: Creation - The keyword 'new' followed by the constructor 'Dog()' are underlined by a bracket above the semicolon. The number '2' is placed above the bracket.

Step 3: Assignment - The equals sign '=' is underlined by a bracket above the semicolon. The number '3' is placed above the bracket.

Deklarasi Objek Java

1

Declare a reference
variable

```
Dog myDog = new Dog();
```

Tells the JVM to allocate space for a reference variable, and names that variable *myDog*. The reference variable is, forever, of type Dog. In other words, a remote control that has buttons to control a Dog, but not a Cat or a Button or a Socket.

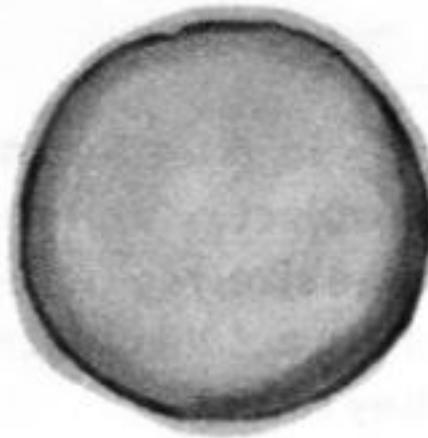

Deklarasi Objek Java

2

Create an object

```
Dog myDog = new Dog();
```

Tells the JVM to allocate space for a new Dog object on the heap (we'll learn a lot more about that process, especially in chapter 9.)

Dog object

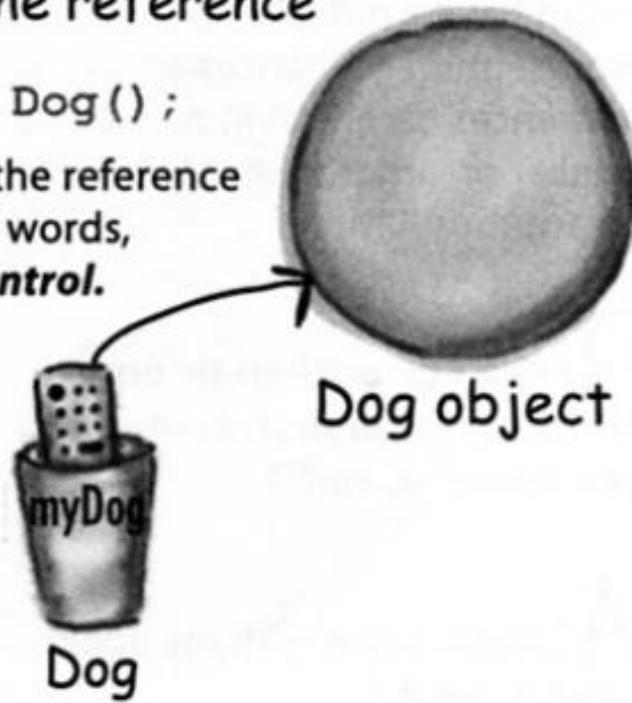

Deklarasi Objek Java

3

Link the object
and the reference

Dog myDog = new Dog();

Assigns the new Dog to the reference
variable myDog. In other words,
programs the remote control.

Penggambaran Objek

Kata Kunci This

```
Public void setUmur(int umur)  
{  
    umur = umur;  
}
```

*Is there something
Wrong???*

Kata Kunci This

1

KATA KUNCI THIS DIBERIKAN PADA
DEKLARASI INSTANCE VARIABEL

2

PERINTAH ini AKAN MEREFERENSIKAN
NILAI KEPADA INSTANCE VARIABLE DARI
CLASS TEMPAT METHOD ITU BERADA

Kata Kunci This

FORMAT PLEASE!!!!

this.nama_variabel

Kata Kunci This

```
Public int setUmur(int umur)  
{  
    this.umur=umur;  
}
```

Kata Kunci Statis

**PERINTAH YANG DIGUNAKAN APABILA
iNGIN MENGGUNAKAN ATRIBUT ATAU
METHOD YANG ADA DI SUATU CLASS
TANPA MENGINSTANSIASI OBJEK YANG
BERASAL DARI CLASS TERSEBUT.**

Kata Kunci Statis

```
class Mahasiswa{  
    static int jumlah;  
    String nama;  
    String nilai;  
    public void setNama(String nama) {  
        this.nama=nama;  
    }  
    public static int getJumlah() {  
        return jumlah;  
    }  
}
```

TAKE A LOOK AT THIS !!!

Kata Kunci Statis

WHERE'S THE OBJECT?

```
Public class StaticTes{  
  
    public static void main(String args[]) {  
  
        //cara pemanggilan static  
  
        System.out.println("Jumlah: "+Mahasiswa.getJumlah());  
  
    }  
  
    //cara pemanggilan non static  
  
    Mahasiswa mhs1=new mahasiswa();  
  
    mhs1.setNama("Adam");  
}
```

Next : Overloading Function

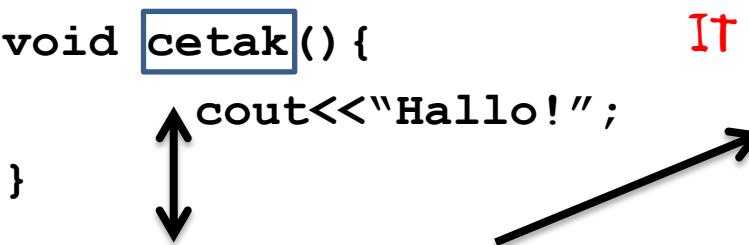

Overloading Function

**MEMBUAT FUNGSI DENGAN NAMA YANG
SAMA TETAPI MEMILIKI PARAMETER
YANG BERBEDA, BAIK SECARA JUMLAH
MAUPUN PENAMAAN PARAMETERNYA.**

Overloading Function

```
class Tes{  
    private:  
        char c;  
  
    public:  
        void cetak() {  
            cout<<"Hallo!";  
        }  
        void cetak( int x ) {  
            int i;  
            for(i=0;i<n;i++)  
                cout<<"Hallo!"<<endl;  
        }  
};
```

IT MAKES DIFFERENCE!!!

Overloading Function

```
Main()
{
    Tes a;
    a.cetak();
    a.cetak(5);
}
```

Keterangan:

1. a.cetak(); akan menampilkan kata Hallo pada layar sebanyak 1 kali.
2. a.cetak(5); akan menampilkan kata Hallo pada layar sebanyak 5 kali.
3. Penamaan void yang ada pada kelas Tes sama tetapi dibedakan oleh jumlah parameter.

Array

An array is like a tray of cups

- 1 Declare an int array variable. An array variable is a remote control to an array object.

```
int[] nums;
```

- 2 Create a new int array with a length of 7, and assign it to the previously-declared int[] variable nums

```
nums = new int[7];
```

- 3 Give each element in the array an int value.

Remember, elements in an int array are just int variables.

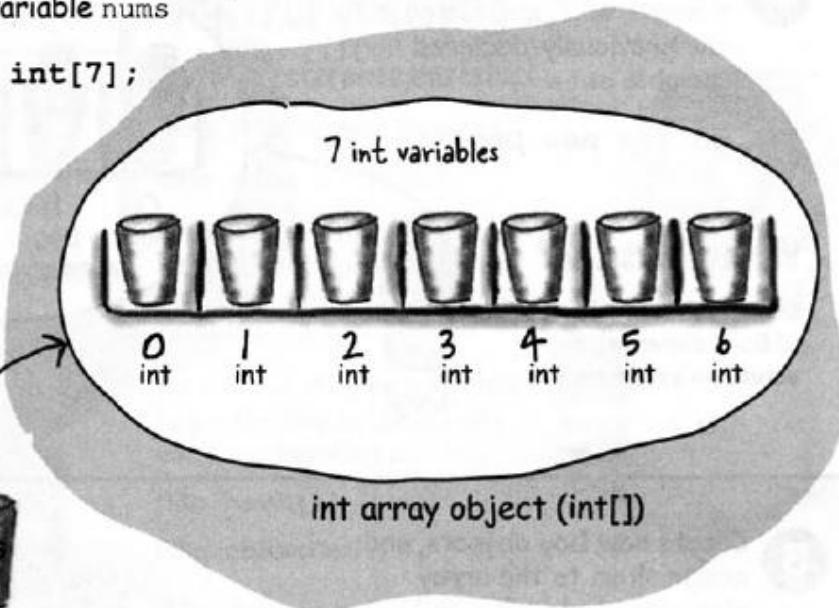

```
{  
    nums[0] = 6;  
    nums[1] = 19;  
    nums[2] = 44;  
    nums[3] = 42;  
    nums[4] = 10;  
    nums[5] = 20;  
    nums[6] = 1;  
}
```

7 int variables

int[]

**ARRAY IS
OBJECT TOO
IN JAVA !!!**

Notice that the array itself is an object, even though the 7 elements are primitives.

**HOW ABOUT ARRAY
OF OBJECT???**

A Dog example

Dog
name
bark() eat() chaseCat()

Array of Object

Make an array of Dogs

- 1 Declare a Dog array variable

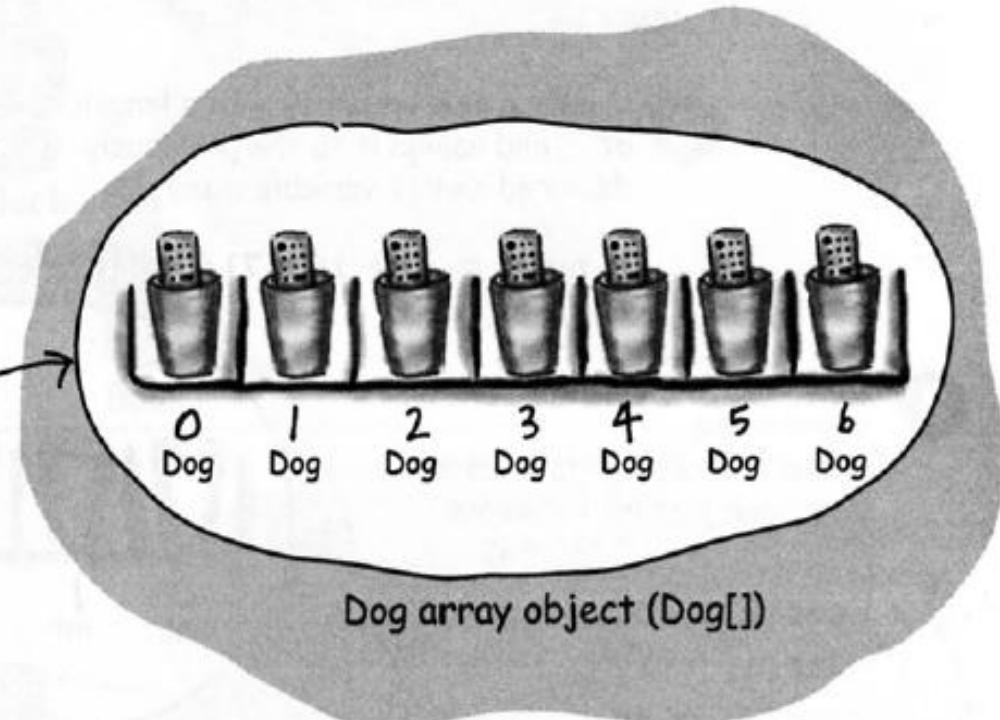

```
Dog[] pets;
```

- 2 Create a new Dog array with a length of 7, and assign it to the previously-declared Dog [] variable pets

```
pets = new Dog[7];
```

What's missing?

Dogs! We have an array of Dog *references*, but no actual Dog objects!

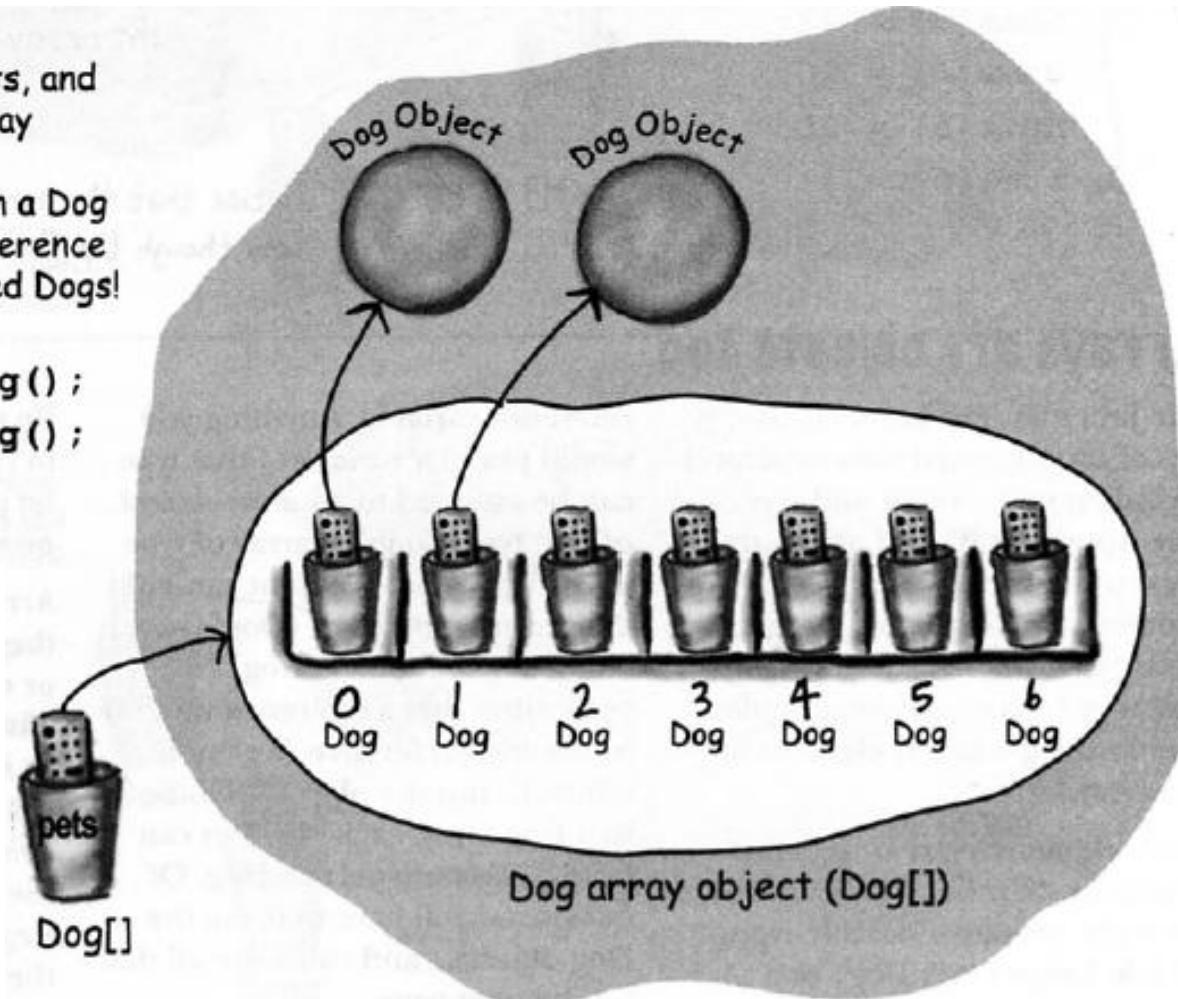

Array of Object

- 3 Create new Dog objects, and assign them to the array elements.

Remember, elements in a Dog array are just Dog reference variables. We still need Dogs!

```
pets[0] = new Dog();  
pets[1] = new Dog();
```

Array of Object

**What happens if the Dog is in
a Dog array?**

We know we can access the Dog's instance variables and methods using the dot operator, but *on what?*

When the Dog is in an array, we don't have an actual variable name (like *fido*). Instead we use array notation and push the remote control button (dot operator) on an object at a particular index (position) in the array:

```
Dog[] myDogs = new Dog[3];  
myDogs[0] = new Dog();  
myDogs[0].name = "Fido";  
myDogs[0].bark();
```

**ENCAPSULATION IS NOT
IMPLEMENTED HERE !!!**

Parameter

- 1 Call the bark method on the Dog reference, and pass in the value 3 (as the argument to the method).

```
Dog d = new Dog();
```

```
d.bark(3);
```

argument

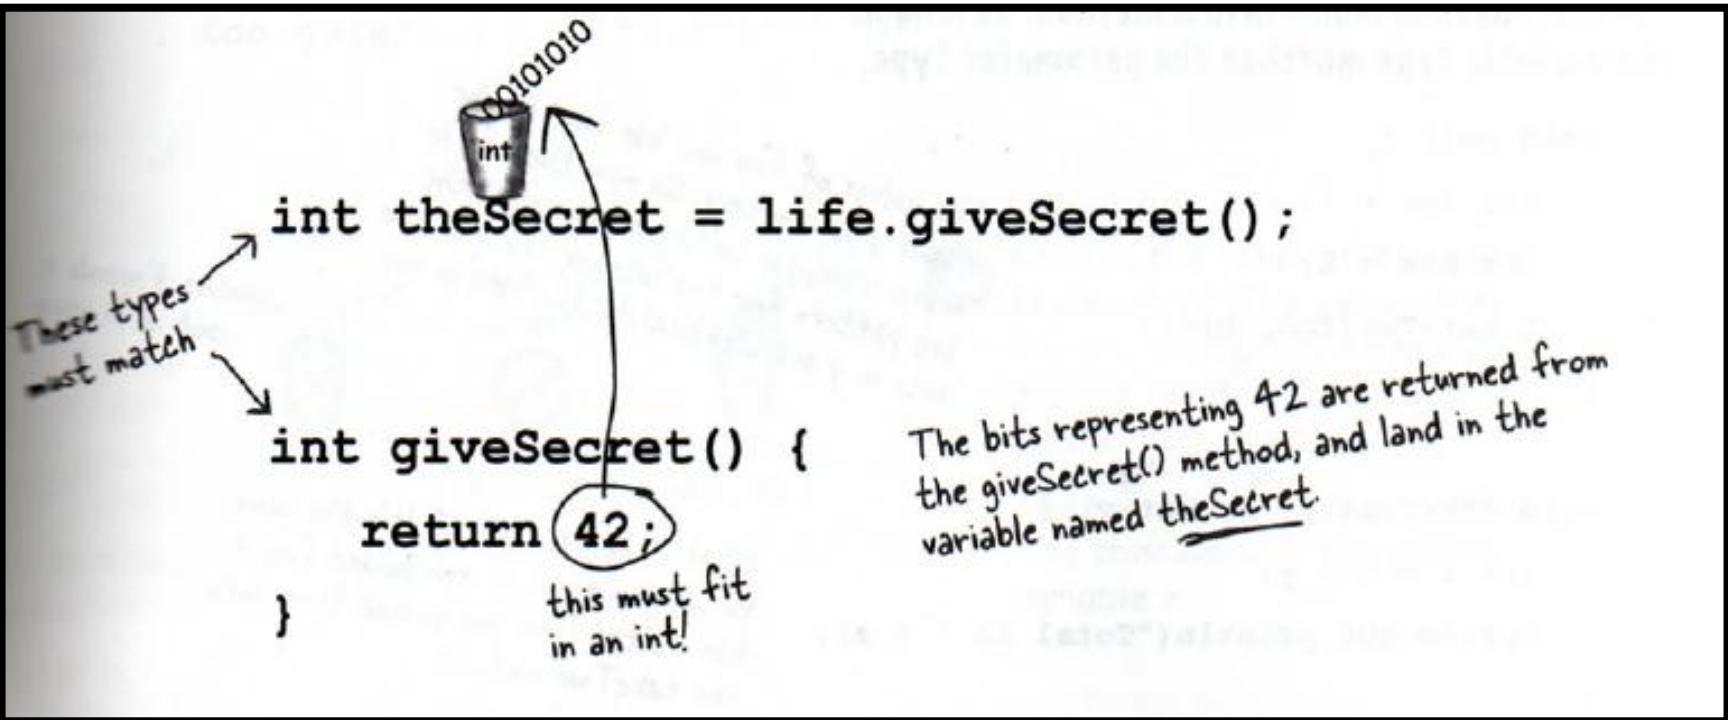

- 2 The bits representing the int value 3 are delivered into the bark method.

```
Parameter  
void bark(int numOfBarks) {  
    while (numOfBarks > 0) {  
        System.out.println("ruff");  
        numOfBarks = numOfBarks - 1;  
    }  
}
```

- 3 The bits land in the numOfBarks parameter (an int-sized variable).

- 4 Use the numOfBarks parameter as a variable in the method code.

Parameter

Parameter

Calling a two-parameter method, and sending it two arguments.

```
void go() {  
    TestStuff t = new TestStuff();  
  
    t.takeTwo(12, 34);  
}  
  
void takeTwo(int x, int y) {  
    int z = x + y;  
  
    System.out.println("Total is " + z);  
}
```

The arguments you pass land in the same order you passed them. First argument lands in the first parameter, second argument in the second parameter, and so on.

Parameter

Java is pass-by-value.

That means pass-by-copy.

```
int x = 7;
```

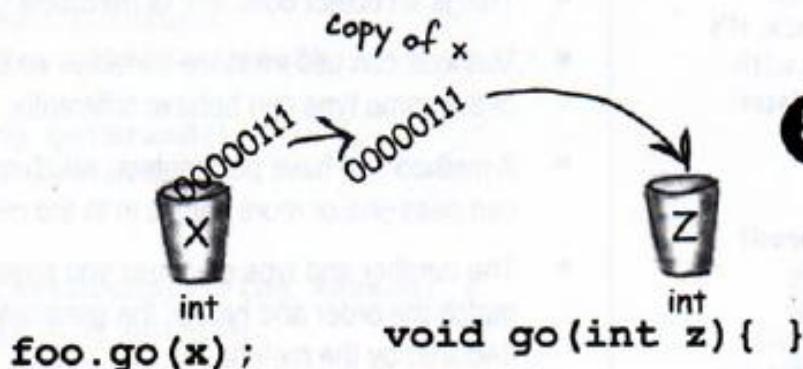

- 1 Declare an int variable and assign it the value '7'. The bit pattern for 7 goes into the variable named x.

```
void go(int z){ }
```

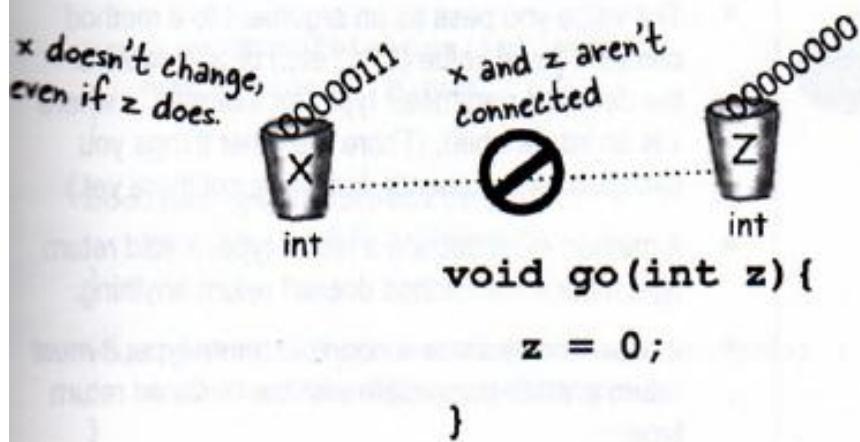

- 2 Declare a method with an int parameter named z.

Parameter

- Call the `go()` method, passing the variable `x` as the argument. The bits in `x` are copied, and the copy lands in `z`.

- Change the value of `z` inside the method. The value of `x` doesn't change! The argument passed to the `z` parameter was only a copy of `x`.

The method can't change the bits that were in the calling variable `x`.

BRAIn STORMING

Be the Compiler 1

A

```
class Books {  
    String title;  
    String author;  
}  
  
class BooksTestDrive {  
    public static void main(String [] args) {  
  
        Books [] myBooks = new Books[3];  
        int x = 0;  
        myBooks[0].title = "The Grapes of Java";  
        myBooks[1].title = "The Java Gatsby";  
        myBooks[2].title = "The Java Cookbook";  
        myBooks[0].author = "bob";  
        myBooks[1].author = "sue";  
        myBooks[2].author = "ian";  
  
        while (x < 3) {  
            System.out.print(myBooks[x].title);  
            System.out.print(" by ");  
            System.out.println(myBooks[x].author);  
            x = x + 1;  
        }  
    }  
}
```

B

```
class Hobbits {  
  
    String name;  
  
    public static void main(String [] args) {  
  
        Hobbits [] h = new Hobbits[3];  
        int z = 0;  
  
        while (z < 4) {  
            z = z + 1;  
            h[z] = new Hobbits();  
            h[z].name = "bilbo";  
            if (z == 1) {  
                h[z].name = "frodo";  
            }  
            if (z == 2) {  
                h[z].name = "sam";  
            }  
            System.out.print(h[z].name + " is a ");  
            System.out.println("good Hobbit name");  
        }  
    }  
}
```

Be the Compiler 2

A

```
class XCopy {  
  
    public static void main(String [] args) {  
  
        int orig = 42;  
  
        XCopy x = new XCopy();  
  
        int y = x.go(orig);  
  
        System.out.println(orig + " " + y);  
    }  
  
    int go(int arg) {  
  
        arg = arg * 2;  
  
        return arg;  
    }  
}
```

B

```
class Clock {  
    String time;  
  
    void setTime(String t) {  
        time = t;  
    }  
  
    void getTime() {  
        return time;  
    }  
}  
  
class ClockTestDrive {  
    public static void main(String [] args) {  
  
        Clock c = new Clock();  
  
        c.setTime("1245");  
        String tod = c.getTime();  
        System.out.println("time: " + tod);  
    }  
}
```

FINISH!!!
