

Information Technology Economics

Information Technology For Management 6th Edition

Turban, Leidner, McLean, Wetherbe Lecture Slides by L. Beaubien, Providence College

John Wiley & Sons, Inc.

Chapter 14

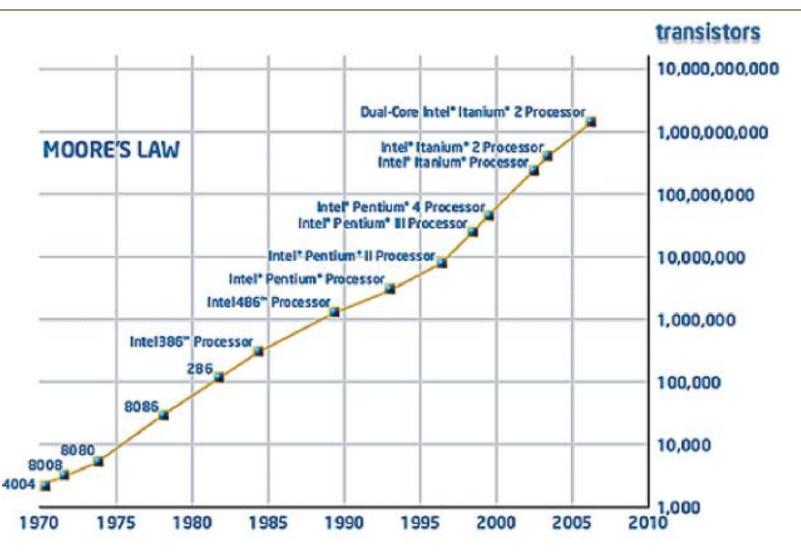

Learning Objectives

- Identify the major aspects of the economics of information technology.
- Explain and evaluate the productivity paradox.
- Describe approaches for evaluating IT investment and explain why is it difficult to do it.
- Explain the nature of intangible benefits and the approaches to deal with it.
- List and briefly describe the traditional and modern methods of justifying IT investment.

Learning Objectives (Continued)

- Identify the advantages and disadvantages of approaches to charging end users for IT services (chargeback).
- Identify the advantages and disadvantages of outsourcing.
- Describe the economic impact of EC.
- Describe economic issues related to Web-based technologies including e-commerce.
- Describe causes of systems development failures, the theory of increasing returns, and market transformation through new technologies.

Moore's Law

Value of Information - Evaluating

One measurement of the benefit of an investment is the value of the information provided. The value of information is the difference between the net benefits (benefits adjusted for costs) of decisions made using information and the net benefits of decisions made without information.

Value of information = Net benefits with information - Net benefits without information

Cost-Benefits Analyses - Evaluating

| TABLE 14.2 IT Investment Opportunities Matrix | | | | |
|---|--|--|--|--------------------------|
| Type of Investment | Example | Comments | Upside Benefits | Probability of Return |
| Infrastructure | Wide area network | Support current business- may allow for future investments | Little itself, but allows new programs | .2 to 1.0 (.5) |
| Required— (compliance), managerial control | OSHA, SOX reporting system, budgets | Usually a cost of doing business | SOX compliance may generate benefits | 0 to .5 (.2) |
| No other way to do the job | Computerized reservations system, air traffic control | Enable new task or process, provide better customer service, new products | Could gain more than forecast | .5 to 1.0 (.75) |
| Direct return from IT | Merrill Lynch, Chrysler | Structure, cost-benefit, and NPV appropriate | A little if you can build on the investment | .7 to 1.0 (.9) |
| Indirect returns | CRS in travel agencies | Potential for considerable return, but indirect benefits hard to estimate | Could be substantial future benefits | 0 to 1.0 (.5) |
| Competitive necessity | Bank ATMs, much EDI, electronic commerce | Need the system to compete in the business; what is the cost of not investing in technology? | Very little if you are following the industry | 0 to 1.0 (.2) |
| Strategic application | Baxter, Merrill Lynch CMA | High risk-high potential; may be able to estimate return only after implementation | A high potential | 0 to 1.0 (.5) |
| Transformational IT | Virtual organizations, Oticon | Must be combined with changes in management philosophy; good for fast-response organization—risky to change structure, but high potential rewards | A high potential | 0 to 1.0 (.5) |

"Costing" IT Investments - Evaluating

- Placing a dollar value on the cost of IT investments is not a simple task. One of the major issues is to allocate fixed costs among different IT projects. Fixed costs are those costs that remain the same in total regardless of change in the activity level.
- Another area of concern is the Life Cycle Cost; costs for keeping it running, dealing with bugs, and for improving and changing the system. Such costs can accumulate over many years, and sometimes they are not even anticipated when the investment is made.
- There are multiple kinds of values (tangible and intangible)
 - improved efficiency
 - improved customer relations
 - the return of a capital investment measured in dollars or percentage
 - many more ...
- Probability of obtaining a return depends on probability of implementation success

Intangible Benefits Sawhney's Method of Handling

• Think broadly and softly.

Supplement hard financial metrics with soft ones

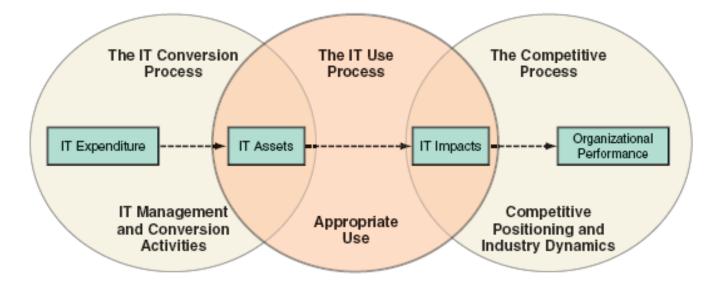

Pay your freight first.

OThink carefully about short-term benefits that can "pay the freight" for the initial investment in the project.

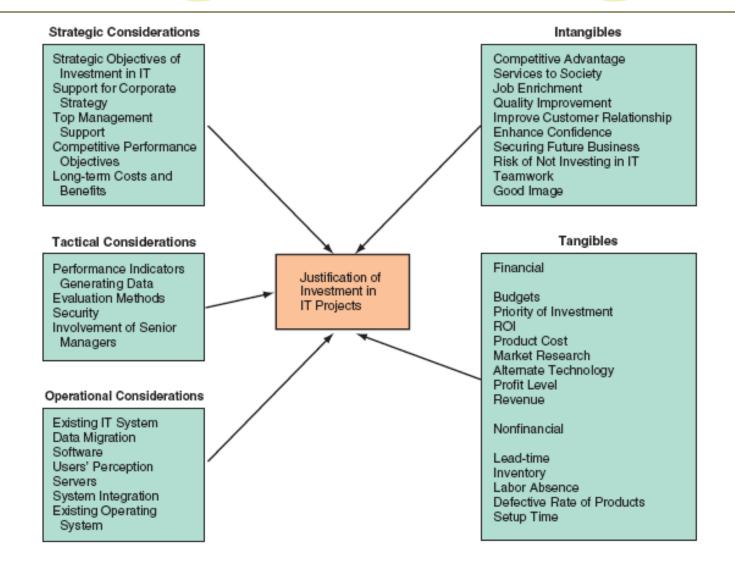

Follow the unanticipated.

OKeep an open mind about where the payoff from IT and e-business projects may come from

Specific Evaluation Methods

Specific Evaluation Methods (Continued)

"Costing" IT – Economic Strategies

TABLE 14.3 | Methods for Evaluating IT Investments

- Value analysis. With the value analysis method, the organization evaluates intangible benefits using a low-cost, trial EC system before deciding whether to commit to a larger investment in a complete system.
- Information economics. Using the idea of critical success factors, this method focuses on key organizational objectives and potential impacts of the proposed EC project on those objectives.
- Scoring methodology. This method assigns weights and scores to various aspects of the evaluated project and then
 calculates a total score. Information economics methods are used to determine the aspects to include in the scoring.
- Benchmarks. This method is appropriate for evaluating EC infrastructure. Using industry standards, for example, the
 organization can determine what the industry is spending on e-CRM. Then the organization can decide how much it
 should spend. Benchmarks may be industry metrics or best practices recommended by professional associations or
 consultants.
- Management by maxim. An organization may use this method to determine how much it should invest in large EC (and IT) infrastructures. It is basically a combination of brainstorming and consensus-reaching methodologies.
- Real-options valuation. This is a fairly complex assessment method, and used only infrequently. It can be fairly
 accurate in certain situations. The idea behind this method is to look at future opportunities that may result from the
 EC investment and then place monetary values on them.
- Balanced scorecard. This method evaluates the health or performance of the organization by looking at a broad set
 of factors, not just financial ones. It is becoming a popular tool for assessing EC projects (see Chapter 11).
- Performance dashboard. This is a variant of the balanced scorecard that is widely used in e-business situations. A
 dashboard is a single view that provides the status of multiple metrics (see Chapter 11).
- Activity-based costing. This managerial accounting concept was adapted for assessing EC investments in recent years
 and has been proven to be fairly successful.

Unfortunately, none of these methods is perfect or universal. Therefore, one needs to look at the advantages and disadvantages of each, which vary according to the specific situation.

Outsourcing

TABLE 14.4 Potential Outsourcing Benefits

Financial

- · Avoidance of heavy capital investment, thereby releasing funds for other uses.
- · Improved cash flow and cost accountability.
- · Improved cost benefits from economies of scale and from sharing computer housing, hardware, software, and personnel.
- · Less need for expensive office space.
- · Reduce and control operating costs.

Technical

- · Access to new information technologies.
- · Greater freedom to choose software due to a wider range of hardware.
- · Ability to achieve technological improvements more easily.
- · Greater access to technical skills not available internally.
- · Faster application development and placement of IT applications into service.

Management

- · Concentration on developing and running core business activity. Improved company focus.
- · Delegation of IT development (design, production, and acquisition) and operational responsibility to suppliers.
- · Elimination of need to recruit and retain competent IT staff.
- · Reduced risk of bad software.

Human Resources

- · Opportunity to draw on specialist skills, available from a pool of expertise, when needed.
- · Enriched career development and opportunities for remaining staff.

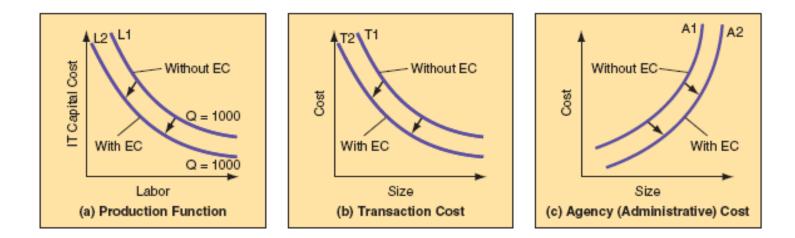

Quality

- · Clearly defined service levels (see Chapter 13).
- · Improved performance accountability.
- · Improved quality accreditation.

Flexibility

- · Quick response to business demands (agility).
- · Ability to handle IT peaks and valleys more effectively (flexibility).

Economic Potential of IT

Web-based Systems – Economic Strategies

Web-based systems can considerably increase productivity and profitability. However, the justification of EC applications can be difficult. Usually one needs to prepare a business case that develops the baseline of desired results, against which actual performance can and should be measured. The business case should also cover both the financial and non-financial performance metrics against which to measure the ebusiness implementation and success.

Most decisions to invest in Web-based systems are based on the assumption that the investments are needed for strategic reasons and that the expected returns cannot be measured in monetary values.

Failures

Information technology is difficult to manage and can be costly when things do not go as planned. A high proportion of IS development projects either fail completely or fail to meet some of the original targets for features, development time, or cost. Many of these are related to economic issues, such as an incorrect costbenefit analysis.

The economics of software production suggest that, for relatively standardized systems, purchasing or leasing can result in both cost savings and increased functionality. Purchasing or leasing can also be the safest strategy for very large and complex systems.

Managerial Issues

- Constant growth and change.
- Shift from tangible to intangible benefits.
- •Not a sure thing.
- Chargeback.
- Risk.
- Outsourcing.
- Increasing returns.
