Journal of Engineering Research

A Refereed Journal, Published by the Academic Publication Council - Kuwait University

Special Issue

In line with the policy of JER to support and cooperate with distinguished international conferences related to science and engineering, this special issue of JER is the results of collaboration with the organizing committee of the 2nd ASEAN Symposium for Science, Engineering, Economic, and Education (the 2nd ASSEEE 2021). Hoping that this fruitful cooperation continues for years to come.

Home / About the Journal

Journal of Engineering Research (JER) is an international, peer reviewed journal which publishes full length original research papers, reviews, case studies related to all areas of Engineering such as: Civil, Mechanical, Industrial, Electrical, Computer, Chemical, Petroleum, Aerospace, Architectural, etc.

JER is intended to serve a wide range of educationists, scientists, specialists, researchers and similar professionals in different engineering disciplines. Our target is to reach all universities, research centers and institutes in the globe.

JER is published quarterly with the **Print ISSN: 2307-1877 and Online ISSN: 2307-1885 with DOI prefix 10.36909** and is planned to serve as an academic medium and an important reference on the advancement and dissemination of research results that support high level learning, teaching and research. Through its publication, the Academic Publication Council of Kuwait University aims to increase the visibility of these scholarly subjects thereby promoting usage of the subjects and their impact on the professional community.

We welcome submission of manuscripts that meet the general criteria with regard to significance and scientific excellence. All articles are duly peer-reviewed prior to publication in JER.

The first issue of JER has been published on 18th June 2013. Click Here to check the latest issue.

The articles published in JER – are indexed, classified, linked, or summarized by: **Scopus**, <u>Chemical Abstract service</u>, <u>Directory of Open Access Journals</u> – Science Citation Index-Expanded (SCIE) and **ULRICH**S Periodicals Directory.

<u>Click here</u> to find the "Author Guidelines" before submitting the manuscript.

ABSTRACT

Mapping is needed to determine the condition of spatial data and non-spatial data from an area. This research produces a mapping application based on geographic information systems that display spatial data and boundaries of 888 villages located in the Greater Bandung Area, which consists of Bandung City, Cimahi City, Bandung Regency, West Bandung Regency, and Sumedang Regency. The method used is the Software Development Life Cycle with Waterfall model. The technology used is the application programming interface from Openstreet MapBox and ArcGIS. Based on testing applications that can access online found that the application built can 100% display the mapping of all areas in the Greater Bandung Area to the district level. This research is useful for developing the tourism and creative industries of MSMEs based on each region's geographical conditions, both for the community and the government.

Keywords: mapping, information systems, spatial, Greater Bandung Area. INTRODUCTION

Mapping an area is needed to determine the condition of the area, both spatially and nonspatially. Various objectives can be obtained by mapping an area. Census activities (Tsutsumida et al., 2019), mapping workers (Ullerud et al., 2018), population (Humphries et al., 2017), and migration (Brovelli et al., 2017). With the mapping application, it is easier for users to see the information needed to obtain information in spatial and spatial form.

1

This research discusses applications for area mapping in the Greater Bandung area. In contrast to several mapping applications, which usually only designate one area (Alkhalidi et al., 2020; Setiawan et al., 2019). Mapping in this research was generally carried out in four major areas in Greater Bandung. The mapping that has been done so far can display spatial data from 888 villages. Therefore, it is different from other studies that only display specific information on the city of Bandung, such as information on the level of crime (Dede et al., 2017) or 3-Dimensional maps (Maulana et al., 2019), as well as mapping of smart villages which only specifically for one village only (Marlintha et al., 2017). This study uses a different technology from several studies that have been conducted because the coverage of the research area is quite extensive. Hence, it is necessary to use the right technique so that the application is not too heavy when accessed online.

The method used to build this application is the Software Development Life Cycle with a waterfall model, often used when building applications (Saxena, 2019). This mapping application was built on a web basis with the PHP programming language. The technology used is the application programming interface provided by OpenStreetMap Mapbox, commonly used for mapping (Syaifudin et al.,2019), and ArcGIS, which is used for processing coordinate data (Falah & Zeinivand, 2019). This research aims to make it easier for users to find spatial information from the Greater Bandung area. The benefits of this research in the future can be used for various fields, one of which is the creative industry sector of MSMEs and tourism.

METHOD

In general, the research method consists of two stages. The first stage is data collection, while the second stage is the software development of the waterfall model life cycle. Figure 1 represents the stages of the research method carried out.

Figure 1 Stages of the research carried out

Data Collection Stages

This stage was the initial stage when carrying out research. This initial stage consists of a literature study, observation, and interviews. Literature studies consist of collecting information from journals, proceedings, and reference books (Orlando et al.,2020). Another stage was observed. This research is intended for use by the general public and government agencies. Direct surveys and observations are carried out to ensure that other sources' spatial data is valid. This direct observation needs to be done to combine the available data sources with (Smith & Sparkes, 2016) the survey results. This research stage results from the latitude and longitude coordinates of 80 districts and 888 villages in the Greater Bandung area, which are implemented as regional boundary polygons.

Another stage in data collection was an interview. The interview stage was used to obtain data related to experience and knowledge (Smith & Sparkes, 2016). Interviews were carried out in the research, namely to the community directly, to get the desired feedback regarding the area mapping application. Several groups of people were interviewed, including entrepreneurs from

the creative industry of MSMEs and those from education. Meanwhile, interviews with government officials were conducted with the Training Center for Cooperatives and MSMEs of the Office of Cooperatives and Small Businesses of West Java Province. Interviews with government agencies were conducted to obtain primary data sources related to spatial areas in the Greater Bandung area.

Software Development Life Cycle Stages

The next stage was the stage when building the system. This stage used the concept of a Software Development Life Cycle with a waterfall model. This waterfall stage is widely used when building a system, including monitoring applications (Afif et al., 2020), reporting (Rahayu, 2020), calculating (Rakhmat & Rizki, 2020), and geographic information systems (Sukenda and Amanillah, 2020), such as in this research. Several stages were carried out: requirement definition, system and software design, implementation and unit testing, integration, system testing, and the last step, namely operation, and maintenance.

The first stage in the software development life cycle waterfall model was the requirements definition. Data in research related to mapping applications is the need for spatial data in the form of polygons containing the boundaries of the area displayed in the application. These areas are Bandung City, Bandung Regency, West Bandung, Cimahi City, and Sumedang Regency. The results of this stage obtained the latitude and longitude coordinates of the areas in Greater Bandung. The coordinates for each region are obtained from the government agency, in this case, the General Government and Public Housing. The coordinates obtained are of type Shapefile file with the format * .shp.

The second stage in the waterfall model was system and software design. Some of the development tools used in this research were ArcGIS, leaflets, MySQL database, SQLYog, and Visual Studio. The specific steps to get the coordinate format displayed in the application are shown in Figure 2.

Figure 2 Stages of getting coordinated.

Shapefile file with * .shp extension is data that shows an object on the earth's surface, such as the shape of an island, administrative boundaries, rivers, and roads. In other words, shapefile files provide information about spatial or spatial data. Shapefiles are also often used for the benefit of building geographic information systems (Bazurto et al., 2019; Colvero et al., 2018) and geometry (Zhu et al., 2019). The shapefile file is opened using the ArcGIS application to obtain coordinate data, as shown in Figure 3.

Figure 3 Stages of getting coordinates from shapefile.

The resulting coordinates can be used in the system. The next step is to convert them into GeoJson format so that they can be used to display spatial data (Horbiński & Lorek, 2020; Zhu & Tan, 2018). GeoJson also has good encoding and decoding performance when used in geographic information (Tong, 2018). This conversion process uses the tools from geojson.io, as shown in Figure 4.

Figure 4 Stages of getting the Geojson format.

The next stage is system and software design. This stage is carried out the design from the procedure, functional, database, model to display design. After the design is complete, the next step is to implement it into a programming language. This application is web-based so that it can be accessed via the internet. The programming language used is the PHP programming language with MySQL database which can also be used for web-based applications (Kolios et al., 2018).

After properly implemented it into the programming language, the system testing stage is carried out to ensure that the implementation results are designed. Testing in this study was carried out by functionally testing each activity to be corrected again when some things were still wrong. The final step in the software development life cycle is operating the application and maintaining the application, especially data.

RESULTS AND DISCUSSION

Data Analysis for Polygon Map

The mapping of districts in the Greater Bandung area is converting data on a conventional map into digital map data, made into a polygon. A polygon is a series of points in a sequence as a basic framework for mapping. Table 1 is sample data for mapping districts in the Greater Bandung area.

District	Polygon Coordinate
Soreang	-7.027363,107.507526 -7.027576,107.507333 -7.027661,107.507075 -7.027619,107.506753 -7.027619,107.506496 -7.027768,107.506238 -7.027884,107.506045 -7.027970,107.505745 -7.028065,107.505487 -7.028193,107.505294 -7.028427,107.505123 -7.028640,107.504930 -7.028853,107.504715 -7.029066,107.504522 -7.029322,107.504393 -7.029556,107.504350 -7.029812,107.504221 -7.030067,107.504221 -7.030344,107.504221 -7.03067,107.504211 -7.030664,107.504629 -7.030642,107.504908 -7.030621,107.505123 -7.030685,107.505359 -7.031217,107.505509 -7.031452,107.505337 -7.031665,107.505123 -7.031750,107.504865

 Table 1 Sample of district polygon

The application in this research can be accessed via the internet at the address http://wirausaha.web.id/view.php?menu=gis&act=frm_gis as shown in Figure 5.

Figure 5 Map display results for the Greater Bandung Area.

There are five regions shown in the application. The five regions are Bandung City with a pink map, Bandung Regency with a blue map, Cimahi City with a cyan map, West Bandung Regency with a green map, and the Sumedang Regency area with a gray map. To display the map in Figure 5, use a script like the following:

In addition to the territorial boundaries for each City and Regency, each village's boundaries also visible. If the boundary is selected, it will display information from the village's name, as shown in Figure 6.

Figure 6 Information on the name of the village.

There are a total of 888 villages in 80 sub-districts spread across the Greater Bandung area. Bandung Regency has 280 villages, Bandung City has 151 sub-districts, West Bandung Regency has 165 villages, Cimahi City has 15 villages, and Sumedang Regency has a total of 277 villages.

The hardware and software specifications used to implement the mapping application for the Greater Bandung area can see in Table 2.

Hardware Type	Specification
Processor	Shared Hosting
Space Hardisk	1,5 GB
RAM	1 GB
Webserver	Apache
PHP Version	7.3
Apache version	2.4.46
MySQL Version	10.3.27-MariaDB
Operating System	Linux

Table 2 Hardware and Software specification.

The web server used in this application is Apache because the apache web server has superior performance in data transfer (Setiawan et al., 2019). Application testing is carried out by functional testing, displaying the five regions in the Greater Bandung area and testing to display 888 villages. Based on BlackBox functional testing, 100% of the area can display information as expected. The results obtained from the tests carried out show that each area can be displayed on the map well, including 888 villages. It can display area name information when the user selects a polygon area.

Applications in this research have been able to display spatial information from five regions in Greater Bandung. Further research is planned so that this application can display non-spatial data as needed. It displays non-spatial data that developed, displaying total entrepreneurial data and total tourism data in each region. Therefore, the community can see and know the potential of each selected area (Setiawan, 2016). Based on the research results obtained, several further potentials can be done so that the results of this research can be more useful for society and government. The availability of spatial information from a total of 888 districts in the Greater Bandung Area can be used more specifically for broader interests such as the distribution of the MSMEs industry, the distribution of industrial potential for each region, and tourist attractions. Of course, to complete the data, there must be further coordination with the relevant government as the data provider.

Figure 7 shows the comparison of the time it takes to display the map for the first time, while Figure 8 shows the time it takes to display the map after the map has been opened. The browsers used on personal computers are Google Chrome, Mozilla Firefox, and Microsoft Edge, while the browsers used on smartphones are Google Chrome, Mozilla Firefox, and the default browser.

Figure 7 Comparison time for view map first time

Figure 8 Comparison time for the view when maps have been opened

Based on the comparison of loading times between the firsttime opening maps and opening maps for the second time, there is a significant difference in load time to display maps. When the map was first opened, it took a long time, from 16 seconds to 23 seconds, for the map to appear. However, after the map has been opened, it does not take long to display the map again, about 2 seconds to 6 seconds, because the map data is stored in the browser's cache (Kim et al., 2017).

Several things are of technical concern, namely due to the large amount of spatial data displayed. The application requires a longtime lag, which is about 23 seconds, using a bandwidth of 100 Mbps and a browser on a smartphone to display spatial information for all areas. This lag is because it takes time for the system to load all the information in GeoJson. Besides, the information displayed does not take too long. It is hoped that the implementation of applications related to the spatial use of better server and network specifications. It is recommended to use a Virtual Private Server to get better performance (Balen et al., 2020), not using the concept of a shared hosting server.

The maps produced in this study can be used for various purposes. Based on the results of a questionnaire to 130 respondents by asking the public's willingness to get additional information from an area on the map. The results show that the highest percentage of people who want information from an area is information related to culinary, tourism, and entertainment. The results of the percentage of desired information can be seen in Figure 9.

Figure 9 Percentage of community willingness to know more information

CONCLUSION

Based on the research results that have been carried out, it is concluded that the mapping application can help know the spatial data of each region which, if developed with non-spatial data, can be known the distribution of potentials contained in each region. The number of maps and coordinates that need to be displayed on the map, making the map display displayed for the first time takes quite a long time, ranging from 10 to 23 seconds depending on the device, browser, and bandwidth the internet connection used. Further research is also needed to accommodate the community's desire to get complete information about an area displayed on the map, which can indirectly help the government increase the resources and potential of an existing area in the Greater Bandung area.

	Mrs. Pooja Vijayan via Open Journal Systems ⊲jer⊜ku.edu.kw> to ASSEEE, me, Angga ↓			Mon, Dec 13, 3:01	PM (13 da	ys ago)	☆	4	:	
© ≥	Dear ASSEEE Conference, Eko Budi Setlawan, Angga Setlyadi,									2
	I am pleased to inform you that your paper entitled "Mapping application for Greater Bandung Area using Web Te (JER).	chnology" has	been acce	epted for publication in	he Journal	of Engi	neering	Resear	ch	
No	The DOI number for this paper will be : 10.36909/jer.ASSEEE.16093*								- 1	
	The editorial board would appreciate it if you cite some papers related to your field in previous issues of our journ	al(JER).							- 1	
	JER looks forward to more distinguished submissions from you and your colleagues.								- 1	
9	Tentatively your paper will be published in the (March/June/September/December 2023) issue.								- 1	
	Please write back to JER to confirm and acknowledge receipt of this mail.								- 1	
	With best wishes.								- 1	
	Prof. Ameer Al Haddad Editor-In-Chief									
	* DOI will be activated only after online publication.
